S15-2 Re-Examining Mortuary Practices and Human Sacrifice through Interdisciplinary Advances

UISPP
TIMIȘOARA 2023

SESSION ABSTRACT

The field of mortuary archaeology has a long and rich history, with many studies focused on understanding the social, cultural, and religious aspects of death and disposal of the dead. However, recent interdisciplinary advances, particularly in the fields of biology, ancient DNA (aDNA), isotope analysis, statistical reasoning, remote sensing and artificial intelligence, have opened up new avenues of inquiry and revealed new perspectives on our understanding of mortuary archaeology and sacrifices.

In this session, we would like to bring together archaeologists and experts from various disciplines, including anthropology, history, and science, to explore the latest developments in interdisciplinary research and to re-examine our understanding of mortuary archaeology and sacrifices.

The following list serves as a suggestion for the topics covered in the communications and discussions, not as a limiting factor.

- The use of ancient DNA analysis to identify human remains and trace population movements.
- The application of isotope analysis in reconstructing diets and mobility patterns.
- The integration of statistical reasoning to improve our understanding of mortuary practices, sacrifices, and rituals.
- The utilization of remote sensing techniques for 3D reconstruction, augmented reality and precise recording of funerary and sacrificial contexts.
- The potential impact of artificial intelligence on revolutionizing our approach to mortuary archaeology.

This session aims to promote interdisciplinary dialogue and inspire new ideas for future research in the field. Additionally, we propose to explore how our understanding of social, cultural, and religious beliefs and practices surrounding death and the afterlife evolves in the context of the technologically developing world.

We strongly encourage authors to investigate exciting new topics that are inspired by the recent cross-disciplinary advances.

S2-1 Interdisciplinary studies on earthen architecture

UISPP
TIMIȘOARA 2023

SESSION ABSTRACT

The aim of this session is to increase interdisciplinarity in the analysis of earthen construction in archaeology, private or public, modest or monumental. We look for examples not only from archaeology (building sequence and systems), but also from micromorphology (of soils, surfaces and building materials), palaeobotany, analytical techniques in physics and chemistry, studies of mechanical properties, etc. We will also draw upon ethnographic studies of traditional vernacular earthen architecture, to observe the viability and survival of some techniques and structures, with the purpose of comparing and understanding architectural solutions that we find archaeologically. An interdisciplinary approach will help us to interpret both the technological knowledge and the motivations of pre- and protohistoric societies that built with earth in different ecological and cultural environments. An interdisciplinary approach is particularly relevant, as recurrently archaeological and ethnographical studies have shown the existence of architectural solutions, in terms of technology or spatial logic, considered inappropriate according to modern construction standards and conventions. With all these examples, we aim to highlight the importance of earthen architecture at the global level, to approach the differences between vernacular and monumental architecture in their cultural setting, past and present, as well as to understand the construction processes at archaeological sites.

S11-1 Continuity, variations, and replacement? Lithic techno-functional traditions and population movements during the Final Palaeolithic in Northern Eurasia

SESSION ABSTRACT

The cyclic glaciations of the Northern Hemisphere resulted in a number of dramatic climatic changes that significantly impacted human occupations in the Northern part of Eurasia. It was only around the onset of the Late Glacial (Greenland Interstadial 1; ca. 15000 BP) that groups of hunter-gatherers began to continuously inhabit extensive regions of the North European Plain. People living in such a dynamic environment adapt and develop different strategies to survive, i.e. subsistence, mobility, and social. These subsistence strategies had very different environmental and geographic ranges varying from reindeer hunting in tundra conditions to elk and small fauna hunting in birch forests. As far as we know, all of the hunter-gatherer societies during the Late Glacial in northern Europe used lithic tools as part of their toolkits, and these were produced using techniques displaying not only cross-cultural but also regional differences within the same culture. The session aims to contribute to the ongoing discussion of continuity and change within the techno-functional traditions of Late Glacial Northern Eurasian communities in relation to recent palaeo-genetic studies. We are especially interested in: a. Final Palaeolithic lithic techno-functional diversity and traditions; b. the relationship between cultural and genetic continuity, modification, and replacement; c. the scale and resolution of integration of assemblage, site, or region with other datasets (genetics, isotopes, dating, etc.).

S21-3 The archaeometry of rock art

UISPP
TIMIȘOARA 2023

SESSION ABSTRACT

In the last decade analyses of prehistoric rock art have become widespread. The combination of different physical and chemical techniques and new methodological approaches has made it possible to determine raw material sources, operational sequences, pigment compositions, and taphonomy processes, among other parameters, which can also have direct implications for the improvement of the chronological framework of rock art sites. Nevertheless, there are few studies linked to the characterization and identification of the organic binders, probably related to technical difficulties, high degradation of the components, or site preservation. The session will consider presentations related to these subjects of rock-art imagery from all chronological periods or cultural traditions. Likewise, papers will be accepted from any rock art site in the world. Finally, since rock-art Archaeometry and Conservation are closely related to other disciplines (Geology or Biology, for example), papers will be accepted from practitioners from other relevant fields of study related to the theme. It is expected that the session will discuss relevant guidelines for archaeologists, geoscientists, physics, chemists, conservators' researchers, and managers. We invite and encourage the participants in this session to debate around the different studies related to pigments, binders, absolute dating, the most recent methodologies, and scientific instrumentation, taking into account the state of the current issue and the future prospects of this line of research.

S20-2 Exploring the relevance of mountain occupation in prehistoric and protohistoric times: a worldwide perspective with a focus on the Carpathians

SESSION ABSTRACT

Mountain archaeology has experienced rapid development in the last decades. This has led to increasing acknowledgment that high-elevation landscapes have played a key role in shaping major processes in human (pre)history, such as large-scale migrations, culture contact dynamics, domestication of animals and plants, technological and subsistence innovations, and so on. Due to preservation and environmental factors these influences appear particularly marked from the end of the Last Glacial Maximum onwards (i.e., 16,000 years cal. BP). Thus, for millennia mountains have been settled and exploited by human societies with a multitude of adaptations taking advantage of the high geological and biological diversity of their unique environments. Today numerous projects are being carried out in different mountain regions around the globe. Archaeological methodologies (from field and topographic survey to excavation) are increasingly being calibrated and adapted to the characteristics of mountain environments, while investigations continue to explore the tensions between the role of such landscapes as barriers versus conduits, and as incomparably rich territories for resource availability versus harsh and hostile areas. The adaptive capacities of past mountain communities, highlighted by archaeologists, are also playing an increasingly important role in the development of novel policies for the management of mountain landscapes and the protection of traditional practices. In this session, we welcome proposals organized as syntheses aimed at highlighting the role of mountains during prehistoric and protohistoric times in different regions of the globe. Given the seat of the conference, papers focused on the Carpathian Mountains are particularly appreciated.

S8-6 Discontinuity, Recycling and Unclassified pieces within knapping processes during the Lower and Middle Paleolithic

SESSION ABSTRACT

The fragmented character of lithic reduction processes during the Lower and Middle Paleolithic is attested on numerous sites, especially for this latter period (Turq et al., 2013). The presence of discontinuous knapping processes in the archaeological record may be induced by mobility patterns, but not only. In the same way, some pieces can fulfill several functions, whether for economic or cultural purposes. This session aims to discuss on which forms the discontinuity exists in the lithic record and their possible causes, in various geographical contexts. We wish to make a particular focus on the artefact which does not always match into a single box (tool/core, core/hammer etc.). In that context this session aims also to discuss recycling phenomenon and secondary uses of artefacts. The idea is to think about the lithic assemblage sometimes outside a strict typology corresponding to prehistorians and not to prehistoric populations. These issues can be addressed through raw materials management (spatio-temporal and techno-economical processes; import, discard and export events), reduction sequences organization (management of chaînes opératoires within a site -simple, ramified etc.) or tool-use (techno-functional studies). The presentations from this session will help us to consider some of the adaptive choices made by hominins, and to determine which part is cultural, functional or economic.

10-3 Upper Paleolithic portable art in Europe

UISPP
TIMIȘOARA 2023

SESSION ABSTRACT

Comprising a wide variety of forms and being made of diverse raw materials (stone, bone, antler, ivory, clay), the importance of art objects in understanding the origin of symbolic behavior and the evolution of the cognitive abilities of hunter-gatherer communities is highly recognized. In the last decades, the number of discoveries has increased, which allowed the filling of some gaps in areas where they were not frequent. In addition, artefacts from older collections, thanks to new study techniques such as high-resolution microscopy, benefited from fresh approaches. Because dating techniques and analysis methods have considerably evolved, besides the description of objects, in the frame of this session we will also focus on interdisciplinary contributions. To have a broader view of symbolic behavior, synthesis studies focused on different regions, chronological contexts or diverse categories of objects are welcome.

S9-1 Middle Paleolithic bifaces from the Caucasus to the Rhine

SESSION ABSTRACT

It was in 1967 when Gerhard Bosinski published his first extensive summary on Middle Palaeolithic bifaces in Central Europe: *Die mittelpaläolitischen Funde im Westlichen Mitteleuropa*, proposing the spatial and chronological division of the identified types of asymmetric bifaces. For the last 55 years, the proposed divisions have been challenged with different approaches and methods. Geometric-morphometric approaches and statistical analyses gave a better insight into the coherence of the assemblages as well as their crucial traits. Use-wear analyses, including the controlled experiments, let us better understand the functional aspect of the bifaces. Raw material analyses let us understand some aspects of typological diversity. The technological and techno-functional approach gave ground for identifying the general structure of the tools as well as understanding their chaîne opératoire process. Besides the considerable potential of the mentioned methods, the in-depth nature of the analytical procedures prevails from obtaining generalised views on the given topic. Therefore, 55 years later, we can get into the individual biographies of single bifacial artefacts, but we still miss the generalised view of their geographical diversity in Central and Southern Europe. By organising the session, we aim to discuss the current state of the art towards the geographical diversity of the Middle Palaeolithic bifaces from the Caucasus to the Rhine. We would like to invite all papers presenting the specific assemblages but also those trying to find more general trends between sites and regions. We invite papers on Middle Palaeolithic bifacial tools analyses from multiple perspectives, including use-wear analyses and typological and technological approaches. We are open to papers related to the specific sites and methods and those focussed on general questions, including the terminology or typological divisions.

S13-3 Crafts and Craftsmanship in the Metal Ages

SESSION ABSTRACT

André Leroi-Gourhan used to say that “civilization stands on the craftsman”. Through time, crafts and craftsmanship have always been an essential part of human life and the foundation of civilizations. They offer us a view of the technological and artistic level of each society and give us the opportunity to understand their social organization. For this session, we would like to invite scholars dealing with craftsmanship to share their research. Aiming to discover other traditions and create discussion around the topic, the session will cover a broad geographical and chronological range from the Mediterranean to Northern Europe and from the Copper Age to the Roman period. The session will be divided into three different themes. The first theme will address traditional archaeological studies, such as chronological issues or technological as well as artistic aspects. The second theme will focus on archaeometric aspects. The scope of processed materials to be considered is deliberately broad and can include: metal, ceramics, stone, glass, wood, amber, etc. Another key intention is to focus on natural resources and their availability, such as material deposits or resources needed for craftsmanship, but also the ecological relations with the environment. The third theme will focus on getting a more comprehensive picture of craftsmanship and its impact on the organisation of societies. This can include questions such as the place of craftsmen in society, the identification of social groups but also operational sequences, or the functioning of trade networks. The main goals of the session are to present new research data on chronological, technological, and artistic aspects as well as facilitating a forum for comparisons between Mediterranean and continental European craftsmanship. Along with the research on natural resources and social and economic backgrounds, the focus will be on the transformation and development of crafts and craftsmanship through the Metal Ages.

20th UISPP World Congress

GS-7 Archaeological Theory and Practice

UISPP
TIMIȘOARA 2023

SESSION ABSTRACT

The field of archaeology lacks a single unified theoretical framework, but this is both its weakness and its strength. Instead, it is a pluralistic and eclectic field, with archaeologists using multiple and conflicting theories and methods in their work. The lack of a single theory reflects the complexity of the questions archaeology seeks to answer and the need to examine the material remains of the past from various perspectives.

This session is a platform for discussion, where new perspectives on established theories and innovative methods for studying archaeology will be presented and discussed among the authors. The focus is on exchanging ideas and fostering communication.

The session will encompass a diverse range of topics. The following list is merely a guideline and not exhaustive.

Established theories. Still relevant today?

- The importance of considering the social, economic, and symbolic dimensions of material culture in interpreting past societies.
- The use of quantitative methods to understand cultural processes and patterns. Systematic investigations of the empirical data.
- Statistical reasoning in archaeology.
- Multidimensional data analysis 50 years after
- Interpretation of data within its cultural context and recognizes the role of the archaeologist as an agent in the production of knowledge about the past.
- Understand the role of economic and social structures in shaping human behaviour and cultural change.
- The role of objects and material culture in shaping human behaviour and cultural meaning.

Archaeology on the eve of AI

- Deep Learning and the brain we would like to have. Should we be enthusiastic, or should we be afraid?
- Neural networks, the next step for big data in archaeology?
- Even more adrenaline? From deep learning (eg feature recognition in big data) to non-human-like intelligent machines (decision trees and rule-based independent systems for processing and interpreting the past)?

A spectre is haunting archaeology – aDNA. Do some studies about ancient DNA have the potential to give birth to a new Cultural-Historical Archaeology?

S4-1 What's new in
(Paleo)anthropology?- Methodology,
concepts and discoveries

UISPP
TIMIȘOARA 2023

SESSION ABSTRACT

The study of the biological aspect of past populations is in constant development and implementation, through the improvement, application, or adaptation of methodologies and most of all by the discovery of new human remains. It is worth noticing that, in recent decades, technological advances in biological anthropology have allowed us to clear some aspects of human evolution and migration. In this context, the UISPP commission "Biological Anthropology" proposes a session that embraces all the anthropological fields of study to maximize the participation of anthropologists from different horizons to stimulate debates and arouse curiosity. In this broad range of topics, a special focus will be given to anthropological studies of Europe's prehistoric populations and migrations from the first peopling until the most recent time. In this sense, we highly encourage graduate students and junior researchers to present their current research to update the anthropologists' community about what is going on in the anthropological sciences.

S5-1 Understanding connections
between mines and other
archaeological contexts

UISPP
TIMIȘOARA 2023

SESSION ABSTRACT

Understanding connections between mines and other archaeological contexts, procurement of flint, radiolarite and other extracted raw materials was an important economic asset and played a significant socio-cultural role amongst Pre- and Protohistoric societies. The attractiveness of raw and processed material from subterranean resources is illustrated by their long distance distribution, along with the variety of archaeological contexts they are recovered from, including settlements, burials, pits, caches, enclosures, etc.

How to interpret the discovery of those elements within various archaeological contexts and sites? Moreover, how could the discoveries of domestic or mortuary items in the vicinity of the mining site allow archaeologists to identify and characterize the communities involved in the extraction or processing of raw materials? Regarding the two previous topics, how to use the local and distribution data to interpret the social, cultural, economic, or territorial landscape of past societies without an overreliance on comparative ethnography?

The organizers wish to broaden the discussed topics to all types of knappable rocks and very early metal (i.e.: copper) during Pre- and Protohistory dependent that: a. the focus is put on the identification of communities involved in the extraction and/or processing of underground resources; b. the focus is put on the interpretation of the same category of artefacts found in various contexts.

S10-1 Archaeology in Banat

UISPP
TIMIȘOARA 2023

SESSION ABSTRACT

The archaeological research of the Banat region refers to a long tradition. Early milestones of publication, already around 1900, were the works of Felix Milleker and Gyula Kisléghi Nagy. Due to the First World War, the geographical Banat was divided into the present-day countries of Romania, Serbia and Hungary. Nevertheless, substantial archaeological work was carried out in the interwar period and during the socialist era. It was only with the opening of the political borders after the fall of communism in 1989, however, that completely new opportunities for large-scale cross-border research arose. Due to the geographical position of the Banat, it is a transit-region for peoples and cultures, and is extremely rich in prehistoric remains, starting with important Middle Palaeolithic sites. Along the Danube-corridor and its tributary rivers, one important immigration route of modern humans into Europe during the Upper Palaeolithic is attested, delivering important Aurignacian sites and early remains of modern humans. In the early Holocene, Mesolithic hunter-gatherers populated this region, constructing settlements like Lepinski Vir. From the beginning of sedentariness, the first Neolithic settlements appear in flood-free areas, which were also visited repeatedly in later times, either to resettle or to bury the dead. Numerous burial mounds are still visible landmarks in the flat landscape. In close proximity to the ore deposits of the Balkan-Carpathian region, very early finds of copper and gold objects are also evident in the Banat. The burials of the Copper Age are conspicuously richly furnished. During the Bronze Age, large-scale fortifications were built in the landscape, which are among the largest in European prehistory. These form important focal points in archaeological research. With a separate session, we want to outline the state of research in this European area. Where does archaeological research stand now and what are the future perspectives of research in this region?

S6-2 Traceology and its interdisciplinary approach to the analysis of wear traces and residues for understanding the evolution of human capacities

SESSION ABSTRACT

Traceology is one of the fields in archaeology that has been designed in an interdisciplinary way. With the interplay of microscopic, experimental, and ethnographic methods, it attempted since its inception in the 1930s to go beyond a solely typological approach to prehistoric artefacts and to give tools made of stone, bone and antler, hitherto regarded predominantly as "index fossils" for a relative chronology, an active role in the reconstruction and assessment of human behaviour, cognition and evolution. Traceology and the study of prehistoric tool functions and technologies is a rather complex task which requires the transdisciplinary interaction of different methods and fields in addition to the archaeological approach, such as microscopy, fracture mechanics, materials science, tribology, chemistry, environmental sciences, ethnography, and experimental archaeology, among others. Traceology is an encompassing research system based on a detailed data and information pool that enables the analyst to identify and interpret wear patterns, residues, and other surface alterations on artefacts. This 'traceological reference collection' is mainly supplied by experiments using tool replicas that imitate prehistoric working activities as realistically as possible as well as execute mechanical, automated processes under defined and monitored parameters.

Complemented by archaeological accounts, ethnographic observations and technical knowledge, this experimental framework is crucial for the reconstruction of prehistoric tool uses and human behavioural responses to changing environments. Although traceological analysis appears to be a straightforward method, its usefulness for the recognition of past human behaviour and human-environment interaction still depends on the understanding of tool use and mechanical processes as well as the research experience of the analyst. Optical microscopy using reflected-light and stereomicroscopes continues to be the methodological backbone of Traceology. In addition, technological innovations in microscopy and material analysis have been introduced in recent years, attempting to overcome specific problems and to achieve better results, among them scanning electron microscopy, laser or white light confocal microscopy, X-ray microanalysis, vibrational techniques as Raman and Fourier transform infrared spectroscopy, GC-tandem MS, and more to use-wear and residue analysis.

The UISPP Commission A17, 'Functional Studies of Prehistoric Artifacts and their Socio-economical Meaning', invites traceologists and archaeologists who work in the interdisciplinary field of microwear and residue analysis to present their latest research and the application of new techniques and instruments to contribute to the methodological debate, and to bring prehistoric tool uses in context with technological advancement, subsistence strategies and adaptation to different environments.

20th UISPP World Congress

S8-1 Lower Palaeolithic all around the world: only Oldowan and Acheulean?

SESSION ABSTRACT

The Lower Paleolithic, while covering an extremely long-time span and large areas in Africa and Eurasia, is usually reduced to two main cultures: Oldowan and Acheulean (Mode 1 and Mode 2). Moreover, most of the features characterizing the Oldowan persist unchanged during the Acheulean. From a chronological point of view, the pathways appear to be heterogeneous for both cultures, and from a paleoanthropological point of view, multiple hominins are associated with similar cultures, and different cultures are associated with the same hominin. In such a fragmented context and, for some periods and geographic areas, often supported by a limited number of archaeological sites, can we define the Oldowan and Acheulean as cultural traditions or techno-complexes? Furthermore, if we define culture as "the complex of manifestations of the material, social, and spiritual life of a population" to what extent can we consider lithic industries to reflect the "complex of manifestations of material life"?

The session "LOWER PALAEOOLITHIC ALL AROUND THE WORLD: ONLY OLDOWAN AND ACHEULEAN?" aims to highlight the different aspects of the Lower Paleolithic lithic complexes, highlighting all the peculiarities and peculiarities that characterized a very long-time span (about 3 million years).

S24-1 The Critical and Evolving Role of Preventive Archaeology in Creating Cultural Heritage Knowledge

SESSION ABSTRACT

Preventive archaeology accounts for a large proportion of the knowledge produced about our common heritage. Its practice, however, is beset by myriad and unevenly applied legal codes, varying levels of quality, and often results in the commodification of scientific research. This paper serves to highlight this situation as well as to suggest strategies for reform that may result in a more globally unified, standardized practice.

S13-2 Interdisciplinarity in Prehistoric and Protohistoric Archaeometallurgy

UISPP
TIMIȘOARA 2023

SESSION ABSTRACT

Archaeometallurgy is one of the fields that has best benefited from interdisciplinarity. Research aimed at studying the origin of metals, the identification of old mines, the dating of ancient extractions, the circulation of metallic materials and the identification of the techniques used and that of production workshops have thus use of various tools and methods borrowed from other sciences. In addition to field archaeology, these studies require cross-cutting approaches that draw on space archaeology, cultural archaeology, experimental archaeology, elementary and isotopic chemistry or even the analysis of artifact manufacturing stigmas, on a macroscopic and microscopic scale. Thus, the joint work of archaeologists, geologists, geochemists, geophysicists, statisticians, geomaticians has proved fertile in developing new approaches for the study of mining and metal remains. The objective of this session is to show fruitful collaborations of various specialties in this particular and pilot field of interdisciplinarity in Prehistory and Protohistory.

S8-2 Lithic-based approaches to understand site formation processes, economy, and technological behaviours during Palaeolithic

SESSION ABSTRACT

The aim of the session is to present interdisciplinary and comprehensive studies of Palaeolithic lithic assemblages. The results obtained from different disciplines focusing on lithics allow to have a quite clear image of the modalities of site frequentation, of the exploitation of the natural environment, of the activities completed in the site and of the post depositional processes that affected the lithic assemblage. The identification of the supply areas of lithic raw materials (both primary and secondary deposits) is a key element to determine land mobility and to eventually distinguish between short-range movements linked to subsistence activities during the periods of site frequentation, and long-range movements eventually linked to seasonal displacements. The technological study gives many information concerning the aims of lithic production, the technological investment, the presence in the assemblage of techno-typological categories eventually referring to the production and use of mobile toolkits, the use of technological expedient or adaptation to the raw materials available, etc. Functional studies are fundamental to recognize the activities carried out during the human frequentation of a site and strongly contribute to the general interpretation of a Palaeolithic context. Finally, the identification, through an accurate taphonomic study, of the post depositional processes that affected a lithic assemblage is pivotal to gain a reliable interpretation of the site under study. Through the different contributions, this section wants to emphasize how an interdisciplinary approach to lithic studies leads to understand the variability of settlement dynamics and technological organization and can strongly contribute to the identification and better definition of site formation processes.

20th UISPP World Congress

S10-2 Current research on the Upper Palaeolithic of Eurasia

UISPP
TIMIȘOARA 2023

SESSION ABSTRACT

New discoveries and the large number of recent research results on the Upper Palaeolithic in Eurasia demand an integrated approach that allows correlation and comparison of data over large areas. Substantial contributions have been made regarding multiple aspects, e.g. chronology and dynamics of occupations, climate, environment, technical behaviour, artistic manifestations, etc., and all of these require a framework for updating and discussing new information. This session aims to integrate and synthesize the last results of archaeological excavations in reference sites, recently discovered sites, scientific advances, datings, models and interpretations that are contributing to go further with our knowledge of the Eurasian Upper Palaeolithic. Furthermore, regional syntheses and comparisons between sites are welcome. The session will be organized within Commission 8 «Upper Palaeolithic of Eurasia» of the UISPP.

20th UISPP World Congress

S12-1 Chalcolithisation

UISPP
TIMIȘOARA 2023

SESSION ABSTRACT

While the term still sometimes designates the development of copper metallurgy alone, it is most often associated with a much broader phenomenon of significant changes in Neolithic societies in terms of the development of social hierarchies, fortifications, trade networks, sanctuaries etc. between the 5th and the 3rd millennium according to the regions of Europe and the Mediterranean. Today, however, this Chalcolithisation does not seem to correspond to a stage of systematic evolution. It would rather be scenarios, different and more or less rapid trajectories depending on the regions, their history, and their relationships. At the same time, Neolithic archeology is increasingly pushing back the dating of certain practices in certain regions. The proposed session aims to explore what is called Chalcolithisation in different regions and to compare the concepts to collectively draw some lessons.

S15-1 Mortuary Practices and Human Sacrifice in Prehistory and Protohistory in Eurasia

UISPP
TIMIȘOARA 2023

SESSION ABSTRACT

The study of mortuary practices and of human sacrifices provides valuable insights into the social, cultural, and religious beliefs of past societies since the beginning of the humankind. Funerary monuments and the vestiges which can be linked with the practice of human sacrifice may reveal aspects concerning the social structure and religious beliefs of communities, but also the cultural strategies and agency of individuals or groups, applied in shaping their identity or enforcing power relations. During the session, we will examine a wide range of funerary discoveries - from the period of 5th - 1st millennia BC - and across the vast territory between the Pacific and the Atlantic. The discussion will highlight both common and unique aspects of mortuary beliefs, practices, and mentalities among the civilizations of Eurasia during this time period. In addition to classical approaches, the session will examine the role of human sacrifices in relation to mortuary practices and how these were used to express religious beliefs and cultural customs. Our goal is to deepen our understanding of the intricate relationships between society, religion, and culture through the study of mortuary practices and human sacrifices.

Topics of the proposed communication and of the expected discussion may include, but are not limited to: a. the role of mortuary practices and human sacrifice in constructing social identities and power relations; b. the significance of mortuary rituals and human sacrifice in religious beliefs and practices; c. the examination of specific regions and cultures in prehistory and protohistory in Eurasia where human sacrifice was practiced; d. the impact of environmental and ecological factors on mortuary practices and human sacrifice; e. revisits and reinterpretations of seminal old funerary and human sacrifices findings in search of new light on the ways in which individuals and communities exercised agency in the past, providing a deeper understanding of the complex relationships between society, religion, and culture. Authors who wish to present findings on funerary monuments and/or evidence of human sacrifices from other geographical regions (Africa, Americas, Asia-Pacific) are encouraged to approach their topics through a comparative study with similar discoveries from Eurasia.

S12-2 Dynamics of Neolithisation in the Banat and Neighboring Areas

UISPP
TIMIȘOARA 2023

SESSION ABSTRACT

The central geographical position of the Banat region between Central and South-Eastern Europe, about halfway between the Black Sea and the Adriatic, makes it an important area across European cultural history. The very flat landscape framed by mountains is characterised by meandering river courses and very fertile soils, which were an important resource for the oldest farmers in Europe. The Banat is of great importance for the spread of the Neolithic from Anatolia and the Aegean to Central Europe. The Balkan type Old Neolithic was already able to spread into this area by the end of the 7th millennium BC. After that, the process of further expansion into Northern Europe stagnated for half a millennium. The reasons for this were certainly manifold and are to be understood as a creative process. At the end of this development stands the genesis of the Linearbandkeramik (LBK), which enabled the Neolithic to spread as far as the Paris Basin and the Ukrainian steppes, and in the north almost to the southern edge of the Baltic Sea. Parallel to this expansion to the north, we record social differentiations in Southeast Europe that culminate in the formation of the Vinča cultural phenomenon. In recent years, interdisciplinary archaeological research has added various facets to the picture of the spread of the Neolithic in the Banat. Genetic studies on human and animal remains of the period shed new light on the actors in this process. New sets of radiocarbon dates obtained in recent years and advances in statistical modelling of data including information from archaeological contexts, offer for the first time precise information of the temporal dynamics of Neolithisation. This session provides a forum for current research on the Neolithic in the Banat and neighbouring regions.

S8-7 Characterizing changing technology, subsistence and settlement dynamics of the Middle Stone Age and Middle Paleolithic

SESSION ABSTRACT

The Middle Stone Age (MSA) and Middle Paleolithic correspond to the time in which modern humans evolved in Africa and began to disperse across Eurasia. While some researchers highlight the differences between late archaic and early modern hominins, other emphasize the broad similarities in their technological adaptations, subsistence strategies and settlement dynamics. This session addresses regional and site-specific case studies to examine and contextualize cultural change and variability during the late Middle and Late Pleistocene, when modern and archaic humans coexisted, at times interbred and likely exchanged knowledge and ideas along the changing interfaces of their territories. The session asks what, if any meaningful differences in technology, subsistence and settlement dynamics distinguished the diverse populations that inhabited the regions of Africa and Eurasia by inviting research to present informative regional and site-based case studies that highlight cultural stasis, continuity as well as subtle and more radical change on different temporal and spatial scale. Papers highlighting new approaches for examining the causes and consequences of social-economic change during the MSA and Middle Paleolithic are particularly welcome.

20th UISPP World Congress

GS-5 Metal Ages

UISPP
TIMIȘOARA 2023

SESSION ABSTRACT

The invention of metalworking was a turning point in human prehistory that changed the course of societies forever. The harnessing of fire to work metals by means of human ingenuity, or as some would say, by feats of heroes and gods, set in motion a chain of events that altered the trajectory of human progress. The pace of transformation in human societies has accelerated ever since, and despite the many advancements and innovations of the modern world, the impact of the Metal Ages remains undeniable. To this day, their legacy continues to shape the way we live and the world we inhabit.

This general session is run jointly by the organizers of the UISPP World Congress in Timisoara and the UISPP's 'Metal Ages in Europe and the Mediterranean' Commission. It provides a platform for meaningful discussion and the exchange of new ideas regarding the transformative journey of humanity, dating back to the time when fire and metal were first combined to create a new world, one of tools and weapons, but also of ornaments and symbols. Join us as we delve into the rich history of the Metal Ages and its impact on societies, from the first sparks of innovation to the eve of history.

This session, welcoming experts working on any aspect of the archaeology of the Metal Ages from around the globe, will explore a diverse range of topics spanning from technology to theory. Whether you are presenting cutting-edge research or building upon existing knowledge, it provides a valuable opportunity to exchange ideas and advance the field.

Any paper or poster relating to the Metal Ages (Chalcolithic/Aeneolithic, Bronze and Iron Ages), that does not fit into any of the thematic sessions, can still be accommodated in this general session.

S1-1 Untold stories. "Marginal" scholars and/or intellectual movements in the history of archaeology

UISPP
TIMIȘOARA 2023

SESSION ABSTRACT

Boucher de Perthes, Pigorini, Montelius, Childe....our histories of archaeology are dominated by this giants of the discipline and from their main intellectual affiliations (evolutionism, cultural-historical approach, New Archaeology and so on). Ezra Zubrow in a paper on the international trends of theoretical archaeology (Norwegian Archaeological Review 1980) wrote that the ship of archaeology doesn't need only helmsmen but also good sailors. The session is devoted to the life and works of these "minor" scholars or to the less debated theoretical movements in our discipline.

20th UISPP World Congress

S1-2 History of the History of Archaeology: between Archaeologists' and Historians' Concerns. Figures, Trends, and Perspectives

SESSION ABSTRACT

Since several decades, historians and sociologists of science scrutinize the history of science as a practice. Loren R. Graham et al., for example, investigated the “Functions and Uses of Disciplinary Histories” in their eponymous edited book (1983). Writing the history of archaeological research, and prehistoric archaeology in particular, has a long history too. It raised the interest of several archaeologists in the early 20th century, such as James Reid Moir, in his paper about the “Position of Prehistoric Research in England” (1917), and Léon Aufrère, with his “Essay on the first discoveries by Boucher de Perthes and the origins of primitive archaeology” (1936, in French). This long-term concern of archaeologists for the writing of the history of their field has continuous occurrences until today, as illustrated by Glyn Daniels' introduction on the “Necessity for an Historical Approach to Archaeology” (1981), Douglas R. Givens' “Short History of the Bulletin of the History of Archaeology” (2002), and Tim Murray's paper addressing “Why the History of Archaeology is Essential to Theoretical Archaeology” (2013). These few references demonstrate, first, the relevance of investigating who are the writers of disciplinary histories and what are the uses of these histories and, second, archaeologists' concern to this regard. This session is intended to strengthen these studies from the case of archaeology. Proposals may relate to, but are not limited to, these topics: a. the status of the history of archaeology as a discipline, sub-discipline, informal network, etc; b. publishing aspects of in the history of archaeology: bibliometrical studies, history of related publishing houses or journals, etc.; c. biographical case-studies about prominent or poorly-known historians of archaeology; d. tension between the global and national dimensions in the practice of history of archaeology; * styles and theoretical trends in the history of archaeology; e. past and current places of the history of archaeology in university trainings in archaeology; etc.

S18 Prehistoric art studies in North Africa and Sahara at the beginning of the 21st Century. Contributions from Interdisciplinary Research Approaches

SESSION ABSTRACT

Prehistoric art (mobiliary, parietal, personal adornments) in North Africa and the Sahara, from the Atlantic to the Red Sea, is a fundamental field of research as it has the potential to reveal the symbolic and intellectual component of prehistoric groups, which are indispensable to a comprehensive reconstruction of the lifestyle of ancient societies. The developments in field research that have facilitated major advancements in the study of economics, environmental and chronological reconstructions have also proven to be of great value to investigations involving prehistoric art. Indeed, the study and analysis of this class of archaeological evidence can also benefit greatly from the application of innovative interdisciplinary approaches. In this sense, scholars are proceeding on a dual path. On the one hand, we can assist with an increasingly careful analysis of the artistic production, which allows identification of representations of elements connected with the real world (tools, dwellings, landscape elements), socio-economic activities (hunting, fishing, gathering, herding, feasting, conflicts), and elements related to the symbolic activities, as known from the excavations. On the other hand, technological approaches aimed at better analysing manufacturing techniques and pigment components, together with more advanced dating techniques, new tracing and documenting methods (e.g., photogrammetry and laser scanning), and development of tools for image enhancement, enrich the available documentation, and open new perspectives for prehistoric art interpretation.

The main goal of this session is to encourage dialogue and exchange among scholars involved in prehistoric art research in the regions from Mediterranean and Atlantic Africa, the Sahara, the Nile Valley, and the Red Sea coast, from the Final Pleistocene to Holocene. We particularly welcome the participation of colleagues working on technology, landscape-rock art sites nexus (i.e., the relationship human groups-landscape-artistic production), systematic reviews or newly discovered sites characterised by the presence of art productions..

S21-2 Pendant or not a pendant? Identification, uses and meanings

UISPP
TIMIȘOARA 2023

SESSION ABSTRACT

Notched or perforated objects, commonly called pendants, constitute one of the main categories of finds in the archaeological contexts. Different methods have been used to create various suspension systems, which facilitated their attachment to the clothing or other items. Some of them were intensively worn, while others may not have been used, and served for other purposes, including social communication and construction of identities. The contexts in which these artefacts are discovered vary and include (broadly defined) both settlement and ritual ones. Nevertheless, the environmental setting and the availability of resources and supply networks, as well as the chronological framework suggest notable differences in the choice of raw materials used for the production of the pendants. In many regions, bone materials, especially teeth, are commonly used for making pendants, while in others shells, various stones, metals and other mineral and organic materials have been favored. Some of the raw materials could be suspended in their natural state, while others were heavily modified to achieve a certain shape or otherwise worked to fulfill particular needs or reflect specific meanings. At the same time, not all suspended objects can be classified as pendants.

This session wishes to explore what defines the pendant and what differentiates these artefacts from other objects. How and with what methods and tools were the pendants produced? How were they suspended and used? What meanings were given to pendants and how these changed when the artifacts were moving between different contexts and communities? With this session, we want to bring together the material, technological and interpretive studies to discuss pendants regardless of the organic or inorganic material. Even though the emphasis is on technological and use-wear analyses, including the modes of attachment and suspension, we also welcome studies dealing with the choices of raw materials, the contexts of use and the meanings of these artefacts. We encourage interdisciplinary contributions studying pendants from different regions and chronological contexts in prehistory.

S21-4 Interdisciplinarity in the study of rock art: the use of new technologies to understand the artistic dynamics of past societies

SESSION ABSTRACT

Rock art is one of the most phenomenal legacies of past societies. It has repeatedly recognized its heritage value as some of the first examples of the art of humankind. Rock art sites represent some of the most visited heritage sites in the world, generating economic and social wealth. Moreover, the emergence and development of symbolism and imagery expressions are considered major milestones in human evolution and a fundamental source to evaluate the organization and complexity of past societies. A lot of the studies of rock art have been based on individual research, limited to personal capabilities and experiences. However, the development of digital technologies offers unprecedented possibilities for a more accurate, detailed, and complex analysis of rock art and its features. This session intends to explore the multi-inter-disciplinary scientific methodologies and the implementation of cutting-edge technologies used in rock art sites nowadays in different contexts. We want to know which different advanced technologies are being used to obtain accurate, commensurate and transferable results in different rock art sites, their advantages, disadvantages, problems, obstacles, and possibilities for future development. We also want to explore the real impact of the use of these technologies on the research concerning the factor for understanding and interpreting its meaning, filling a gap, and unblocking current research. Furthermore, it is important to understand how the technological way of approaching rock art has been important to unravel questions such as hierarchy, gender, inequality, division of labour, and knowledge transmission in the context of past societies.

20th UISPP World Congress

S21-1 Archaeoacoustics: a novel interdisciplinary way of studying the past

SESSION ABSTRACT

Following several pioneering studies in the second half of the 20th century regarding the use of sound by past societies, it is in the 1990s that the interest in Archaeoacoustics reaches a significant level among researchers. Archaeoacoustics forms part of a multidisciplinary field of research, sometimes still beset by methodological difficulties but is, as mentioned by Scarre (2006), “potentially a vital part of the understanding of the lived experience of past societies”. Following on from a milestone Conference organized in 2003 at the University of Cambridge, other events about Archaeoacoustics have been organized in several different countries since, with contributions that constitute today a considerable part of the specialised bibliography on this theme, and complement several additional publications that provided a broad view of Archaeoacoustics. This new discipline, which attempts to recreate the soundscapes of the past, emerged from various experimental methods, and the organisers encourage these types of approaches, which sometimes may take the form of performances. We should note that Archaeology per se is very much one aspect of the understanding process which is hampered by the survival (or not) of a material culture. We stress that the intangible aspects of the past have long since disappeared. It is our responsibility that we re-colour the past by applying a more sensory approach to the available archaeological record. The organisers intend to have an interdisciplinary session, gathering researchers from different disciplines such as archaeology, experiential archaeology, acoustics, ethnomusicology, archaeoacoustics, anthropology and psychology, among others, with the aim to better understand the ancient human social contexts and sequent behaviours. We are particularly interested in presentations concerning early musical behaviour, shamanism, the representation of musical instruments and/or dancing scenes in prehistoric art, “ringing stones”, the acoustics of classical Greek and Roman buildings and of medieval churches, music archaeology, the effects of specific sounds on the human brain, as well as other possible approaches to the use of sound in past human contexts that interested participants may wish to propose.

S23-1 Prehistory and society: museums, education and media

UISPP
TIMIȘOARA 2023

SESSION ABSTRACT

The role of Prehistory in society has evolved throughout over 150 years of research and education, but fundamentally remains focused on four core and crucial domains: the affiliation of the human past to a natural history of human evolution; the building of expanded scales of time and space when perceiving and understanding life; the approach to the mechanisms of human adaptation to contextual changes, including human agency; the understanding of the integrated nature of analytical sciences, fostering on one hand interdisciplinarity and, on the other, social participation in the construction of scientific data (transdisciplinarity). Also, the means of knowledge socialization have structurally remained the same: the organization of collections of past remains (artifacts and ecofacts) and their interpretation in museums; the construction of new knowledge through research-based education; the promotion of massive dissemination of knowledge through communication media. These latter dimensions include the crucial integrated conservation, study and protection of both sites, moveable heritage and documentation associated to heritage, together with a development dimension that includes daily life of local inhabitants.

Although the tools in each of these chapters may have changed from the mid-19th century to the dawn of the 3rd millennium, they remained fundamentally similar in purpose and strategy: an historical understanding of the past, rooted in reason and science. However, for the past few decades, and particularly since the beginning of this century, social relevance of History has been growingly challenged by discourses on memories and identities, with relevant impact on museums (growingly focused on narratives and performance, and less in remains and processes) and on education (growingly focused on context-based stories and not on human natural history). Even if media has changed less, since its focus has always been “dramatic novelty”, the contemporary trend towards showcasing isolated “scenes” and curiosities, rather than wicked processes also has relevant implication for society.

This session calls for contributions reflecting on these mechanisms and trends, but also on the challenges and responsibilities of prehistorians in these three domains: museums, education and communication. The session calls for a reflection on the need to structure networks of museums as a matrix for promoting the social understanding of prehistory as an integrated approach of diverse human, social, natural and hard sciences. The organizers invite contributors to namely reflect on the interaction between museums, research, education and the structuring of socially shared mindsets.

S7-1 Archaeometry of prehistoric and protohistoric stone, metal, ceramics and glass

SESSION ABSTRACT

The UISPP Commission for archaeometry presents a proposal for a session covering all aspects of analytical approaches applied to the study of archaeological finds of stone, metal, ceramics and glass. Materials of all periods from Prehistory to the medieval protohistoric cultures and civilizations will be taken into consideration. Special attention will be given to the quality of analytical performances. Special cases on how general problems concerning the various materials can be solved by applying diverse analytical methodologies, case studies on ancient quarries, the production of stone artifacts from various contexts, researches on mining, analyses of smelting remains, metal finds, metal workshop remains, ceramics of all kinds and periods, and researches on glass production, glass workshops, glass/glazed objects, coloring of glass/glaze and pigment will be collected and presented in different sections. A further aim of this session is to share the latest results and experiences that can provide useful information, the comparison of several methods and technologies, and the possibilities of standardization of test and database protocols.

20th UISPP World Congress

S8-3 “Simple but not simplistic”: Discussion on Bipolar Technology from different perspectives

SESSION ABSTRACT

Erret Callahan (1987) defined bipolar reduction as a type of rectilinear knapping involving a core between a hammer and an anvil, with the force oriented directly into the anvil rather than obliquely away from it. Bipolar knapping has been reported as a reduction or retouch strategy in different parts of the world from the Early Stone Age up to the 20th century. Even if in the last two decades its definition, description, and the confusion with wedges and chisels have attracted debate on lithic analyses, its identification, either as a knapping method or a knapping technique, still poses difficulties or is a source of controversy amongst many lithic analysts. In lithic technology studies, bipolar knapping has often been associated with a lack of ability in the knapping capabilities of hominins. Following this pejorative vision of this type of knapping, bipolar knapping has sometimes been associated with females or children by those that consider it as a simplistic way of knapping with low skill requirements. However, ethnographic studies, past and present, are helping to break down this negative perception of bipolar technology. Between the 1970s and 1980s, important ethnographic studies were conducted in North America, Africa, Asia, and Oceania that clearly demonstrated the complexity and variability of this type of lithic strategy and dismantled disparaging views and simplistic gender and age associations. The different types of applications of this knapping method or technique have already proved that it is not as simple a strategy as one might think, and it can even demand a notable knowledge of raw materials and rock mechanics. Some analysts have suggested that the lack of predetermination needed and ease involved in producing bipolar blanks is an indicator of an intelligent expedient lithic strategy to get the most out of raw materials. Thus, as Callahan proposed decades ago, it is simple but not simplistic. Besides the technological interpretation of this type of reduction, consideration should also be given to the social and cultural aspects associated with it, attested in many ethnographic works. In light of all of these aspects and issues, the bipolar technique still offers a set of unresolved controversies for Pleistocene and Holocene archaeology. Numerous experiments have been conducted in the last two decades towards the identification of this type of reduction and to clarify the confusion with intermediate pieces. Perhaps the challenge in the coming years is to decipher the variability associated with it and the economic and social implications of this technological choice. In short, the variation associated with bipolar reduction still has to be described and unpacked. Our session focuses on the bipolar technique in archaeological contexts incorporating lithic technology, ethnographic perspectives through archaeological analysis, methodological studies, and experimental work. Our aim is to evaluate and discuss the concept of bipolar knapping with regard to multiple approaches. In our session, all avenues within the framework of the bipolar phenomenon will be considered.

S8-4- Stone Age engineering techniques and their implication for understanding Neanderthals and early Homo sapiens perspectives

SESSION ABSTRACT

Research into human uniqueness is gaining increasing importance in prehistoric archaeology. Arguably the most striking behaviour unique to early and modern humans is that they used fire to transform the properties of materials. In archaeology, these processes are sometimes termed “engineering” or “transformative techniques” because they aim at producing materials with altered properties. Early engineering may even have been the key factor that separated early humans, such as Neanderthals and early Homo sapiens, from other hominins. However, research on such techniques is still rare and only sporadic data on isolated artefacts are known. This scarcity is rooted in the analytical difficulties imposed by the material leftovers associated with transformative techniques. This session will host talks and presentations of new findings related to such techniques. The three best-known Stone Age transformative techniques, stone heat treatment; glue making; and colour enhancement of pigments, constitute the main focus of the session. But the session is open to presentations on all kinds of engineering techniques in the world and from different periods. This large-scale approach may provide a comprehensive dataset on how these techniques were invented and conducted, discuss new analytical tools and allow to understand the role of technical processes for cultural evolution.

S8-5 Shape and Beats: Combining technology and computational shape analysis of studying the variability of Large Cutting Tools

SESSION ABSTRACT

The emergence of the Acheulean is one of the major transitions in human evolution and the appearance of its iconic large cutting tools such as handaxes and cleavers, is considered as reflecting a major revolution in many cognitive and behavioural aspects of Early Pleistocene hominins. Nevertheless, the different criteria on which their typological classification is based remain vague and have varied substantially with time and between the different schools corresponding to the significant morphological variability exhibited by these tools across time and space.

Shape is recognised as one of the most important attributes of stone tools, forming the basis for typological, technological and functional reasoning. Nevertheless, its 3-dimensional, complex and irregular nature renders its quantitative description and analysis challenging and non-trivial. In the last decades, the proliferation of 3D digital scanning technologies supported a new computational approach to the analysis of archaeological artefacts. This, in turn, gave rise to numerous methods and tools which now allow to quantitatively characterise, analyse and compare assemblages of stone tools in terms of their shapes.

This session aims to provide a venue for presenting recent studies of Large Cutting Tools applying a combination of classical lithic technology with a computational approach to shape analysis, to discuss:

1. the concept of variability, searching for its sources, limits and consequences;
2. the pros and cons inherent to the use of new avant-garde techniques in the study of the Middle Pleistocene industries;

best practice in the combination of qualitative and quantitative research approaches, such as technological and computational shape analysis of stone tools.

S25-2 Hunting: a diachronic perspective on its role on human subsistence from the Pleistocene to the Holocene

SESSION ABSTRACT

Hominine hunting strategies during the Pleistocene and the Holocene are broadly characterized by a diversification in the target's choices, variously related to the available animal resources. The accessibility of these prey may have been conditioned by various constraints such as changes in the environment and climate, the natural availability of the animals, technological skills, social organization and even taste preferences. The diachronic perspective of subsistence behavior allows a reconsideration of the human relation with his environment and particularly, the complex relations between humans and animals over the long term. The multidisciplinary approaches permit to contextualize hunting strategies and their evolution. This session aims to bring together specialists who deal with subsistence strategies applying new approaches, methods, and innovative diagnostic techniques and ethnographic comparisons by addressing the following topics:

- Hunting vs Scavenging
- Big game hunting
- Small game hunting
- Selective hunting
- Hunting technologies
- Hunting and breeding
- Hunting and prestige

S25-1 Percussive osseous industry a human revolution between pre-formation and waste selection

SESSION ABSTRACT

Archaeologists have developed a growing interest in the study of the bone industry related to percussion, particularly for Paleolithic periods. This type of industry became frequent, notably such as the manufacture of bone retouchers, but not only, and recent papers highlight the possible use of some bone fragments as hammer or anvil. Most of these tools originated from herbivore long bones, although some specific elements such as tusk fragments, teeth or antlers were common too. Zooarchaeological analysis, in addition, application of new methodologies such as proteomics, confocal microscopic analysis are complementary to answers to essential questions about this type of animal hard materials (ivory, antler, bones) industry:

1. origin of the bone tools and pseudo bone tools,
2. place in the technical equipment of the hunter-gatherers,
3. blank selection: pre-formation of the blank during the butchering process or selection after, among the butchery waste,
4. *in situ* used or possible transport, regarding the delay after butchery process and use and finally the abandonment.

The inclusion of these artifacts in animal hard material in the *chaîne opératoire* of debitage or lithic tool shaping in a perspective of cross and multidisciplinary analyses allows a global vision of the use of these retouches on lithic tools. The use of animal hard material retouchers responds to technical needs related to lithic knapping. The knowledge of both the lithic material and the hard material of animal origin depends on the skills of the knappers. It also implies a good knowledge of the tool technology and its use.

In this session, we bring together researchers working across the broad field of the osseous and flint industries. We propose studies from different points of view:

- Morphometric and geometric-morphometric analyses (blanks),
- Spatial analyses (blanks and marks),
- Archaeological experiments (neo-taphonomy),
- Functional and use analyses (blanks and marks),
- Technological analyses,
- Raw material (teeth, tusk, bone, flint, quartz...),
- Traceology of different lithic materials,
- Typology and nomenclature of the marks,
- Proteomic and DNA (taxonomy).

Instead of focusing on one method, this session aims at exploring how different methodologies may complement each other within and between cases of study and projects to provide a more nuanced understanding of the technical behaviors related to the bone and lithic industry through the Paleolithic and the diverse humanities. Papers may focus on case studies, theoretical frameworks and the development of specific methodologies related to the percussive osseous industry.

S17-1 Multi-faceted Pyroarchaeology: from environmental to cultural proxies

SESSION ABSTRACT

As fire is multi-functional, pyroarchaeology is multi-faceted. Pyroarchaeological research encompasses both natural as well as archaeological fire, while we recognise the latter and its traces as artifacts. The field relies on a large variety of methods to obtain environmental and behavioral proxies informing us on technology, diet, cultural activities and settlement patterns. For example, occupation intensity or fuel choice are some of the proxies that can be obtained by studying fire and their residues. Their analysis can reveal cultural choices or environmental restrictions and variability. This session will be open to contributions from the multiple disciplines concerned with the study of ancient fire, whether these studies provide behavioral or environmental information, or focus on the evolution of different uses of fire, from the origins of fire use to its application in more complex technological innovations. The session is not limited to the analysis of archaeological materials; experimental approaches and contributions from ethnography or ethnoarchaeology are also welcome. We also welcome contributions on pyrotechnology and its cognitive, cultural and social implications; the multiplication of the uses of fire with time comes with a growing impact of fire as part of the human technical repertoire. We encourage the presentation of papers about new approaches to overcome the difficulties related to the characterization of ancient anthropogenic fires.
